Backend and mobile engineer (Android, C#/.NET, Flutter) with hands-on applied AI/ML experience — from a production arrival-prediction model to computer-vision research in PyTorch and OpenCV. Co-founded a shuttle-tracking startup serving 2,500+ weekly active users while shipping enterprise features at SOTI.

EDUCATION

Bachelor of Software Engineering (Co-op) — McMaster University **Graduated April 2025**

GPA: 3.7/4, Dean's Honour List

Relevant Coursework: Large System Design, Data Structures and Algorithms, Databases, Operating Systems, Real-Time Systems

SKILLS

Backend: C#/.NET, TypeScript, Python, SQL, REST API design, Firebase (Firestore/Realtime DB)

Mobile: Flutter, Kotlin/Java (Android), Firebase, iOS fundamentals

Applied AI/ML: PyTorch, OpenCV, Google ML Kit, CARLA

Languages: Java, Python, Dart, C#, C/C++, Go, PHP, JavaScript/TypeScript, Bash

Tools & Practices: System Design, Concurrency, Data Structures & Algorithms, Git, Jenkins, Gerrit, CI/CD, Agile/Scrum, Linux, Android Studio, Xcode

EXPERIENCE

Associate Software Developer — SOTI Inc. (Full-time) **May 2025 – Present**

- Own delivery of feature epics on SOTI Snap, an enterprise low-code app platform — defining requirements with stakeholders and designers, planning architecture and technical trade-offs, and directing ticket grooming, assignment, and demos across Android, server, and QA teams, plus internal Snap app developers building customer-facing apps.
- Leading end-to-end delivery of a Smart Scanner feature (Google ML Kit OCR and barcode recognition, live-camera zone detection, C#/.NET server configuration) that replaces manual data entry for customers capturing high-volume data — e.g., shipping labels — into Snap App forms; extending it with Zebra DataWedge scanning (license plate, VIN, tire).
- Built a network request caching system giving ~100,000 SNAP devices offline-first reliability — automatically resubmitting failed third-party API calls with zero data loss once connectivity returns.
- Use Claude, integrated into the team's daily workflow, to accelerate technical planning and architecture exploration.

Co-Founder, Director & CEO — Trac Software Solutions Inc. (Part-time) **May 2025 – Present**

- Co-founded and lead Trac (tracinc.ca), a real-time shuttle-tracking platform serving 2,500+ weekly active users across Android and iOS; personally write 75%+ of the backend codebase while owning business operations end-to-end — financials, customer relationships, and product roadmap.
- Grew Trac from a McMaster capstone project into a profitable, revenue-generating business entering its second year of operation.
- Secured a B2B partnership with Attridge and lead outreach to expand service beyond McMaster to new institutional customers.
- Built and integrated a machine learning model that predicts shuttle arrival times from historical stop-level wait times and operational data, using Kalman filtering for real-time GPS smoothing and A* to calculate stop-level routing distances.

Software Engineering Intern — SOTI Inc. **May 2023 – August 2024**

- Built an internal C#/.NET tool that uses binary search across batched PRs to identify which one broke a build and notifies the developer — cutting investigation time by ~80% (about an hour to under 10 minutes).
- Diagnosed and fixed flaky BDD/E2E automation tests and authored 150+ new BDD tests with reliable underlying scripts, cutting failure frequency by ~40% and stabilizing the CI/CD pipeline.
- Implemented feature requests and resolved customer-reported bugs in Java, Kotlin, and C# across MobiControl, SOTI's enterprise device management (UEM) platform.
- Diagnosed and fixed a circular dependency bug in the MobiControl Android agent that was causing concurrency issues, improving product reliability and stability.

Undergraduate Research Assistant — McMaster Faculty of Engineering **January 2023 – May 2023**

- Designed and tuned a PID controller with real-time OpenCV camera-feed processing, improving RC car path-following accuracy from ~60% to 90–95%, and built a GIPPS car-following simulation with an MQTT-based communication protocol for multi-vehicle coordination.

PROJECTS & LEADERSHIP

Autonomous Self-Parking Cars (paused) **July 2024 – October 2024**

- Built a C++ data pipeline in CARLA to spawn vehicles and capture and label 10,000+ bird's-eye-view images of candidate parking spots.
- Began training a PyTorch CNN (ResNet-based) for supervised parking-spot detection; project paused ahead of a planned reinforcement-learning phase.

HMI/UX Co-Lead & CAV Team Member — McMaster EcoCAR EV Challenge **Oct 2021 – May 2023**

- Co-led a 5-person team within a multi-year autonomous-vehicle competition; also on the CAV subteam.
